CS 491: AR applications

Above are pictures I took using the Ikea Catalogue app. This app allows users to go through Ikea's furniture and place it in your living spaces to see how it would look. In the first picture you can see the scenario where there is furniture in a place you wouldn't normally see it. I put a bed frame in the middle of street by house. The next picture was an armchair I placed in my living room. It looks a little off because I couldn't get the hang of how to adjust the scale of the chair.

As we can see from the images above, we can see the potential of Augmented Reality. We are able to place furniture or in general objects into our real world. I feel like this opens up ways of connecting people through our technology. Something that I instantly thought of when I started tinkering with the app and working on this assignment was that you could possibly create an app where people could create "hang out areas". Specifically people could find an area in the world and use this said app to add in cool objects or furniture where people can come and experience their personal spaces. The developer could also add interactability to the areas like cool mini-games. This also can help people with moving in the future. People could set up their living space with an idea with certain furniture in mind. There's endless possibility in what can be done with applications like this.
