Birdly

The technology I will be talking about and discussing is the Birdly that Cang Le presented. This technology is a way for VR users to experience flying. Specifically it will allow users to feel like a bird flying. This flying simulator is very expensive at a whopping $189,000. This makes it highly unavailable for common consumers to own because it is just too expensive. There are ways to experience it because some places do own it so that people can play around with it. I do find this technology something I would really want to try out because I am curious about what it feels like to fly around like a bird. What I think this could provide would be a freeing experience with exploring cities or areas by flight. Ultimately, I think this technology is definitely something that I would try and think others should try since it brings a unique experience for VR users.
