

This week's assignment was to check out the AR apps that interact with the sky and show us the stars and planets. Our task was to view where the Moon and Saturn are and take pictures. I used the app SkyView to find the Moon and Saturn. As you can see above I took those pictures. The first picture is a picture of Saturn and the second picture is a picture of the Moon with other planets behind it. I'm not sure if this is how the app works but I thought I'd find them looking in the sky.

Next we should imagine a future with an app like this is built into AR glasses. I feel like this would be a nice app for someone who owns these AR glasses if they are interested in space. Instead of using a telescope a person would look at the sky with these glasses and will be able to easily tell what they're looking at. I think this would be a cool thing to mess around with and learn about stars and planets. I think it'd be cool to add information like anyone ever visiting the planets or rovers visiting planets. Along with that, adding information that was learned from these people or rovers. Things like

is it possible to live on these planets.
